

The l3pdfdict package—tools for PDF dictionaries

L^AT_EX PDF management testphase bundle

The L^AT_EX Project*

Version 0.95a, released 2021-02-22

1 l3pdfdict documentation

Many PDF objects are or contain dictionaries—structures containing a number of (pdf-)name/value pairs. Examples are attributes of links, filespec dictionaries, xform dictionaries, the catalog, the info dictionary. The commands in this module offer an number of tools to handle such dictionaries. The module setups a name space for the dictionary names and offers some commands to output dictionaries.

The dictionaries work in many respects like property lists with a few PDF specific changes:

- The keys are always converted with `\str_convert_pdfname:n` to get a correct PDF name;
- a key with a empty value can not be added, it will be ignored;
- there is a dedicated function to output the property as space separated list with keys with slash: `/key1 value1 /key2 value2`.

Local and global dictionaries can be created.

1.1 User Commands

<code>\pdfdict_new:n</code>	<code>\pdfdict_new:n {<dictionary name>}</code>
-----------------------------	---

<code>Updated: 2020-12-03</code>	This function create a new local or global dictionary. Which one depends on <i><dictionary name></i> : If it begins with the standard g the dictionary is global, with l the dictionary is local, other starting chars will give an error. It is recommended to begin the name in the standard expl3 naming scheme with one or two underscores and a module name, so <code>g_module_XXXX</code> or <code>g__module_XXXX</code> .
----------------------------------	--

<code>\pdfdict_set_eq:nn</code>	<code>\pdfdict_set_eq:nn {<local dictionary name₁>} {<dictionary name₂>}</code>
<code>\pdfdict_gset_eq:nn</code>	<code>\pdfdict_gset_eq:nn {<global dictionary name₁>} {<dictionary name₂>}</code>

<code>New: 2020-06-16</code>	This functions copy <i><dictionary name₂></i> into <i><local/global dictionary name₁></i> locally or globally. If the dictionary <i><local/global dictionary name₁></i> doesn't exist yet, it will be created. If <i><dictionary name₂></i> doesn't exist yet, an error will be raised.
<code>Updated: 2020-12-03</code>	

*E-mail: latex-team@latex-project.org

<hr/> <code>\pdfdict_put:nnn</code>	<code>\pdfdict_put:nnn {<local dictionary>} {<name>} {<value>}</code>
<code>\pdfdict_gput:nnn</code>	<code>\pdfdict_gput:nnn {<global dictionary>} {<name>} {<value>}</code>
<hr/> New: 2020-04-06	<p>This function puts key <i><name></i> and value <i><value></i> locally or globally in the <i><dictionary></i> created with <code>\pdfdict_new:n</code>. <i><name></i> should be a PDF Name without the starting slash. It will be stored with <code>\str_convert_pdfname:n</code>, so will be automatically correctly escaped in case it contains slashes, spaces or other chars not allowed in a PDF name. <i><value></i> should be a valid PDF value for this name in the target dictionary. The value is <i>neither</i> converted <i>nor</i> escaped automatically. If the value is blank nothing is added to the dictionary.</p>

When adding a value keep in mind that the expansion behaviour of the backends differ. Some backends expand a value always fully when writing to the PDF, with other backends commands could end as strings in the PDF. This makes controlling the expansion quite tricky. It is better to not rely on *<value>* to be expanded nor not expanded by the backend commands.

<hr/> <code>\pdfdict_item:nn *</code>	<code>\pdfdict_item:nn {<key>} {<value>}</code>
<code>\pdfdict_item:ne *</code>	A simple command to output key-value as <code>/key value</code> . This is needed to output dictionaries in mapping commands. The command doesn't do any escaping, it expects that the name has been escaped when the value has been stored into the dictionary. If the value is blank nothing is output. The command is expandable if the content is it.
<hr/> Updated: 2020-12-04	

<hr/> <code>\pdfdict_use:n *</code>	<code>\pdfdict_use:n {<dictionary>}</code>
<hr/> Updated: 2020-12-03	This outputs the property list of the dictionary as a list of <code>/key value</code> pairs. This can be used e.g. when writing a dictionary object with <code>\pdf_object_write:nx</code>

<hr/> <code>\pdfdict_show:n</code>	<code>\pdfdict_show:n {<dictionary>}</code>
<hr/> Updated: 2020-12-03	This shows the content of <i><dictionary></i> in the log and on the terminal.

<hr/> <code>\pdfdict_if_exist_p:n *</code>	<code>\pdfdict_if_exist:n {<dictionary>}</code>
<code>\pdfdict_if_exist:nTF *</code>	This tests if the dictionary exists.
<hr/> Updated: 2020-12-03	

<hr/> <code>\pdfdict_if_empty_p:n *</code>	<code>\pdfdict_if_empty:n {<dictionary>}</code>
<code>\pdfdict_if_empty:nTF *</code>	This tests if the dictionary is empty. The result is false if the dictionary doesn't exist.
<hr/> Updated: 2020-12-03	

<hr/> <code>\pdfdict_get:nnN</code>	<code>\pdfdict_get:nnN {<dictionary>} {<name>} <tl var></code>
<hr/> New: 2020-07-06	<p>Recovers the <i><value></i> stored by <code>\pdfdict_put:nnn</code> or <code>\pdfdict_gput:nnn</code> for <i><name></i> and places this in the <i><token list variable></i>. If <i><name></i> is not found then the <i><token list variable></i> is set to the special marker <code>\q_no_value</code>. <i><name></i> is first converted with <code>\str_convert_pdfname:n</code>. The <i><token list variable></i> is set within the current T_EX group.</p>

<code>\pdfdict_remove:nn</code>	<code>\pdfdict_remove:nn {<local dictionary>} {<name>}</code>
<code>\pdfdict_gremove:nn</code>	<code>\pdfdict_gremove:nn {<global dictionary>} {<name>}</code>

Updated: 2020-12-03 Removes $\langle name \rangle$ and its associated $\langle value \rangle$ from the $\{ \langle dictionary \rangle \}$. The removal is local from local dictionaries and global from global dictionaries. If $\langle name \rangle$ is not found no change occurs, *i.e.* there is no need to test for the existence of a name before trying to remove it. $\langle name \rangle$ is first converted with `\str_convert_pdfname:n`.

2.2 Creating dictionaries

`\g__pdfdict_names_seq` Two seq to store the used names for diagnostics.

```
\g__pdfdict_gnames_seq 39 <*package>
40 \seq_new:N \g__pdfdict_lnames_seq
41 \seq_new:N \g__pdfdict_gnames_seq
42 </package>
```

(End definition for `\g__pdfdict_names_seq` and `\g__pdfdict_gnames_seq`.)

`__pdfdict_name:n` This are the commands to create new dictionaries and to access their internal name. All internal names start with `g__pdfdict_` or `l__pdfdict_`.

`__kernel_pdfdict_name:n` For the other modules we also need a kernel command to access the internal name

`__pdfdict_new:n` to speed up the code and allow the use standard commands of the `prop` module to deal with the dictionaries. For example

`\pdfdict_new:n` `\prop_clear:c { __kernel_pdfdict_name:n { name } }`

```
43 <*package>
44 \cs_new:Npn \__pdfdict_name:n #1 % #1 dictionary name
45 {
46   \str_head:n{#1}__pdfdict_/#1_prop
47 }

```

(End definition for __pdfdict_if_empty:n and \pdfdict_if_empty:n. This function is documented on page ??.)

__pdfdict_put:nnn These are the commands to store values into the dictionaries. The main difference to
\pdfdict_put:nnn adding values to a normal property list is, that the keys are converted with \str_
__pdfdict_gput:nnn convert_pdfname:n and that empty values are ignored.

```

\pdfdict_gput:nnn
144 <*package>
145 \cs_new_protected:Npn \__pdfdict_put:nnn #1 #2 #3 %#1 (local) dict, #2 name, #3 value
146 {
147   \tl_if_blank:nTF { #3 }
148   {
149     \msg_warning:nnnn { pdfdict }{ empty-value }{ #2 }{ #1 }
150   }
151   {
152     \__pdfdict_if_exist:nTF { #1 }
153     {
154       \exp_args:Nnx \prop_put:cnn
155       { \__pdfdict_name:n { #1 } }{ \str_convert_pdfname:n { #2 } }{ #3 }
156     }
157     {
158       \msg_error:nnn { pdfdict }{ unknown-dict }{ #1 }
159     }
160   }
161 }
162
163
164 \cs_set_eq:NN \pdfdict_put:nnn \__pdfdict_put:nnn
165 \cs_generate_variant:Nn \pdfdict_put:nnn {nnx, nno}
166
167 \cs_new_protected:Npn \__pdfdict_gput:nnn #1 #2 #3 %#1 global dict, #2 name, #3 value
168 {
169   \tl_if_empty:nTF { #3 }
170   {

```

```

171     \msg_warning:nnnn { pdfdict }{ empty-value }{ #2 } { #1 }
172   }
173   {
174     \__pdfdict_if_exist:nTF { #1 }
175     {
176       \exp_args:Nnx \prop_gput:cnn
177       { \__pdfdict_name:n { #1 } }{ \str_convert_pdfname:n { #2 } } { #3 }
178     }
179     {
180       \msg_error:nnn { pdfdict } { unknown-dict } { #1 }
181     }
182   }
183 }
184
185 \cs_set_eq:NN \pdfdict_gput:nnn \__pdfdict_gput:nnn
186 \cs_generate_variant:Nn \pdfdict_gput:nnn {nnx,nno}
187 \end{package}

```

(End definition for __pdfdict_put:nnn and others. These functions are documented on page 2.)

__pdfdict_get:nnN Recover the values. The name must be first escaped to match the stored name.

```

\pdfdict_get:nnN
188 \begin{package}
189 \cs_new_protected:Npn \__pdfdict_get:nnN #1 #2 #3 %dict,key,macro
190 {
191   \__pdfdict_if_exist:nTF { #1 }
192   {
193     \exp_args:Nnx \prop_get:cnN
194     { \__pdfdict_name:n { #1 } }
195     { \str_convert_pdfname:n { #2 } } { #3 }
196   }
197   {
198     \msg_error:nnn { pdfdict } { unknown-dict } { #1 }
199   }
200 }
201
202 \cs_set_eq:NN \pdfdict_get:nnN \__pdfdict_get:nnN
203
204 \end{package}

```

(End definition for __pdfdict_get:nnN and \pdfdict_get:nnN. This function is documented on page 2.)

__pdfdict_remove:nn This removes a name/value pair from a dictionary. The name has to be passed through the escaping.

```

\pdfdict_remove:nn
\__pdfdict_gremove:nn
\pdfdict_gremove:nn
205 \begin{package}
206
207 \cs_new_protected:Npn \__pdfdict_remove:nn #1 #2 %dict,name
208 {
209   \__pdfdict_if_exist:nTF { #1 }
210   {
211     \exp_args:Nnx \prop_remove:cn
212     { \__pdfdict_name:n { #1 } }{ \str_convert_pdfname:n { #2 } }
213   }
214   {
215     \msg_error:nnn { pdfdict } { unknown-dict } { #1 }

```

```

216     }
217 }
218 \cs_set_eq:NN \pdfdict_remove:nn \__pdfdict_remove:nn
219
220 \cs_new_protected:Npn \__pdfdict_gremove:nn #1 #2 %dict,name
221 {
222     \__pdfdict_if_exist:nTF { #1 }
223     {
224         \exp_args:Nnx \prop_gremove:cn
225         { \__pdfdict_name:n { #1 } } { \str_convert_pdfname:n { #2 } }
226     }
227     {
228         \msg_error:nnn { pdfdict } { unknown-dict } { #1 }
229     }
230 }
231
232 \cs_set_eq:NN \pdfdict_gremove:nn \__pdfdict_gremove:nn
233 </package>

```

(End definition for __pdfdict_remove:nn and others. These functions are documented on page 3.)

__pdfdict_show:Nn This allows to show the content of dictionaries. It also displays if a dictionary is local or global. If both exists both are shown.

\pdfdict_show:n

```

234 <*package>
235 \cs_new_protected:Npn \__pdfdict_show:Nn #1#2 %#1 message command, #2 dict
236 {
237     \prop_if_exist:cTF { \__pdfdict_name:n { #2 } }
238     {
239         #1
240         { pdfdict }
241         { show-dict }
242         { \tl_to_str:n {#2} }
243         { \prop_map_function:cN { \__pdfdict_name:n { #2 } } \msg_show_item:nn }
244         { \__pdfdict_get_type:n{#2} }
245         { }
246     }
247     {
248         #1 { pdfdict } { unknown-dict } { #2 } {}{}{}
249     }
250 }
251 \cs_new_protected:Npn \pdfdict_show:n #1
252 {
253     \__pdfdict_show:Nn \msg_show:nnxxxx {#1}
254 }
255 </package>

```

(End definition for __pdfdict_show:Nn and \pdfdict_show:n. This function is documented on page 2.)

__pdfdict_item:nn

__pdfdict_item:ne

\pdfdict_item:nn

\pdfdict_item:ne

```

256 <*package>
257 \cs_new:Npn \__pdfdict_item:nn #1 #2 %#1 name, #2 value
258 {
259     \tl_if_blank:nF {#2} { /#1~#2~ }
260 }

```

```

261 \cs_generate_variant:Nn \__pdfdict_item:nn {ne}
262 \cs_set_eq:NN \pdfdict_item:nn \__pdfdict_item:nn
263 \cs_generate_variant:Nn \pdfdict_item:nn {ne}
264 \endpackage

```

(End definition for `__pdfdict_item:nn` and `\pdfdict_item:nn`. This function is documented on page 2.)

`__pdfdict_use:n` `\pdfdict_use:n` outputs a prop as needed in a dictionary: as a list of `/⟨key⟩⟨value⟩` pairs.

```

265 \begin{package}
266 \cs_new:Npn \__pdfdict_use:n #1 %#1 dict
267 {
268   \prop_map_function:cN { \__pdfdict_name:n { #1 } } \__pdfdict_item:ne
269 }
270
271 \cs_set_eq:NN \pdfdict_use:n \__pdfdict_use:n
272 \end{package}

```

(End definition for `__pdfdict_use:n` and `\pdfdict_use:n`. This function is documented on page 2.)
